

Project Title
ShowOnAI

Year
2025

Role
FE & BE Developer

Link
Not publicly available

Project Description

ShowOnAI is a full-stack SaaS platform designed to help brands monitor and optimize their visibility on AI-powered search engines such as ChatGPT, Perplexity, and Gemini. It features an analytics dashboard tracking Share of Voice, Brand Mentions, and SEO reporting, alongside a user onboarding flow, demo request system with email notification integration, and a blog CMS with SEO metadata & JSON-LD support.

TEAM PROJECT (3 developers). My role: Frontend & Backend Developer responsible for the Next.js frontend, RESTful APIs, and optimized PostgreSQL queries for large-scale data.

Impact: Delivered a working SaaS MVP capable of tracking AI search engine presence, a capability that most existing SEO tools do not yet offer.

What I learned: I deepened my understanding of full-stack architecture (Next.js + Go microservices), containerised deployment with Docker, and how modern AI search engines surface web content differently from traditional search.

Project Title
SIGAP

Year
2024

Role
AI & IoT Developer

Link
Not publicly available

Project Description

SIGAP is an AI & IoT-based driver monitoring system for real-time microsleep detection, developed for Samsung Innovation Campus Batch 6 (AI+ in Everyday Life). It integrates computer vision using MediaPipe for facial landmark analysis with IoT hardware (ESP32-CAM) to detect drowsiness indicators and trigger real-time alerts to prevent accidents.

TEAM PROJECT. My role: AI/Computer Vision Developer responsible for the MediaPipe drowsiness detection pipeline, alert logic, and monitoring dashboard.

Impact: Won 2nd Place [International] at Samsung Innovation Campus Batch 6 (2024), competing nationally hosted by Hacktiv8 Indonesia. The system addresses a critical road safety problem with a low-cost, deployable hardware-software solution.

What I learned: I gained practical experience combining computer vision with IoT hardware, learned to optimise real-time inference pipelines for embedded devices, and understood the importance of latency in safety-critical systems.

Project Title

Wellborne

Year

2025

Role

Full Stack Developer

Link

Not publicly available

Project Description

Wellborne is a desktop application for automated oil and gas well risk assessment. It automates density, leakage, and scoring calculations based on industry-standard rulesets, supports bulk data import via Excel, and exports professional reports to both Excel and PDF. Interactive data visualisations are powered by Plotly, and the app is packaged as a standalone .exe for field use.

TEAM PROJECT (2 developers). My role: Full Stack Developer responsible for the core risk calculation engine, UI, and report generation.

Impact: Reduced manual calculation time significantly for well engineers, replacing error-prone spreadsheet workflows with a validated, auditable desktop tool.

What I learned: I gained hands-on experience in desktop GUI development with Python/Flet, domain knowledge in oil and gas engineering risk scoring, and the discipline of building software for non-technical end-users in a regulated industry.

Project Title <i>Official Website FKUB Makassar</i>	Project Description The official website for FKUB (Forum Kerukunan Umat Beragama) Kota Makassar, a city-level interfaith council. The site features a landing page, news and articles, a photo gallery, and a digital registration system for houses of worship. INDIVIDUAL PROJECT (Contract). I was the sole developer, responsible for design, development, deployment, and ongoing administration. Impact: Gave FKUB Makassar its first professional online presence, enabling the public to access institutional news and submit worship registrations digitally, reducing administrative overhead for the council. What I learned: I experienced the full software delivery lifecycle end-to-end, from client requirements gathering and UI design in Figma, through Next.js + MySQL development, to production deployment and DNS configuration. Project Title
Venture

Year
2024

Role
Full Stack Developer

Link
github.com/zultopia/Venture

Project Description

Venture is a digital platform built to help small vendors (warung) in Jakarta transition into the digital economy, offering integrated payments, inventory management, and sales tracking. It was built during HackJakarta 2024 (AngelHack & RISTEK CS UI) and reached the finals as one of the Top 5 teams out of 20+ in the Financial Inclusion track.

TEAM PROJECT (4 developers). My role: Full Stack Developer responsible for the Next.js backend API, database schema, and payment gateway integration.

Impact: Demonstrated a viable product for financial inclusion, impressing judges at Grab Office, Jakarta South Quarter, targeting micro-entrepreneurs with limited digital financial tools access.

What I learned: Building under hackathon pressure taught me rapid prototyping, product prioritisation, and pitching to a non-technical audience. I also learned how to integrate third-party payment APIs securely within a tight deadline.

Project Title PhyloGeoVis	Project Description PhyloGeoVis is an interactive web application that merges phylogenomic analysis with geospatial visualisation to support conservation prioritisation of three endangered orangutan species across Indonesia. Features an interactive phylogenetic tree (Neighbor-Joining & Maximum Likelihood), genetic diversity indices, Population Viability Analysis with Monte Carlo simulation, and an interactive distribution map sourced from GBIF and NCBI GenBank. TEAM PROJECT (5 developers). My role: Full Stack Developer responsible for the React frontend, interactive map (Leaflet.js), phylogenetic tree rendering, and bioinformatics data pipeline integration. Impact: Produced a research-quality tool that makes complex biodiversity data accessible to conservation practitioners without bioinformatics expertise. What I learned: I explored bioinformatics and conservation science, learning to translate scientific algorithms into interactive visualisations, reinforcing technology's role in environmental and social good.
